Beside (v392, 13/10/2026, management c1, in its own name): the field law in curved spacetime. [REAL in the kernel; conditional on the named H3] The sentence above and the v390 token (`FIELD_EQUATION_IN_CURVED_SPACETIME_NOT_A_KERNEL_TERM`) hold for the *type* of the statement (the closure of `QGSolutionComplete`), not for the kernel: "Clausius on every null screen ⇒ Einstein, with unique Λ and coefficient $8\pi G$" is a term since v317/v338, and the text wrote it as if none of this were a term — that is where the translation failed. Since v392 the stone `TGLExt.LiganteLeiCampoCurvo` binds that implication by a term, *conditional on the named H3* (the null projection $\mathrm{Ric}(k,k) = 8\pi G\, T(k,k)$ at every point and null direction, [KNOWN] in Jacobson 1995, not derived from the state); the existence of a metric or of a solution, local or global, stays without a term, and the gate does not move (record `lei_de_campo_curvo_v392`). The old text stays.

Beside (v392, 13/10/2026, management c1, in its own name): the scale of β. [DERIVED from a reading; to be vetoed] The sentence "That convergence *is* the measurement that the invariant does not run" stays as a record: the tabulated convergence was reclassified on 08/08/2026 (`evidence_audit`), and no record of this programme computes the figure of 0.05 per cent. The non-running of $\beta_0 = \alpha(0)\sqrt{e}$ rests on the Scale Theorem, which is structure, and the sharpened prediction (the coefficient of the dephasing law is independent of ω) stays armed, with no live channel today. The v388 `WHICH_MU_PER_RITE_OPEN` stays as a record: the operator fixed on 07/10/2026 that the scale of β was already defined (verbatim, sha256 `a6c4912afc6f0dc4`) and every rite charges β_0 ($\mu \to 0$, Thomson), with $\beta(\mu) \geq \beta_0$ as a bulk reading, beside it (record `beta_escala_errata_v392`). Gap: the structure gave the convergence as support, not as the measurement, and the translation lost the date of the reclassification.

Beside (v392, 13/10/2026, management c1, in its own name): the annihilating word. [INPUT from the operator] The normalised annihilating polynomial is the *letter*: the operator said on 07/10/2026 (verbatim, sha256 `259a1bf14a66fbc9`) "polinômio aniquilador normalizado=letra (por isso palavra, mas ali como letra)" (translated: normalised annihilating polynomial = letter; hence "word", but there as a letter). The stone that reads with the letters is the WORD (PALAVRA, `TGLExt.Palavra`, record `palavra_v392`); the "annihilating word $X \cdot q$" of the paragraph above reads, therefore, as a letter. Gap: the structure already said letter; the translation called a word what the operator named a letter.

Beside (v392, 13/10/2026, management c1, in its own name): the CMB-S4. [DECLARED; to be checked at the primary source] The sentence above, which makes β_{TGL} await "the radiation era at CMB-S4", inherited the calendar of the 08/08/2026 frozen file (∼2027 to ∼2032) and treated CMB-S4 as an expected instrument. CMB-S4 stands as closed down (route map, seq 402 and 607; F5.2 audit, sha16 `c0bb3c964c8af74e`); the admission of those sources by sha256 (D8) is the operator's, and no calendar is asserted here (record `cmb_s4_errata_v392`). Gap: the structure said only "the radiation era"; the name of the instrument and its calendar came from the frozen file, and the translation did not date them.

Beside (v392, 13/10/2026, management c1, in its own name): who bears witness. [INPUT/ONTO; text sent by the operator] The refusal of the word above is a refusal of accreditation, not of validity, and the reading of who bears witness is the operator's (10/10/2026, sha256 `87a3752d8c8e5dd3`): "o observador testemunha a luz e a luz dá testemunho de si mesma" (translated: the observer bears witness to the light and the light bears witness to itself). It is a verbatim quotation, not a verdict (record `cunhagens_v392`). Gap: the paragraph refused accreditation without saying who bears witness.

Beside (v392, 13/10/2026, management c1, in its own name): the ladder and the flags. [REAL in the source and in the v391 core] The number of "clean theorems" above is the external ladder of the kernel (`len(ext_flags)`, the flags of reserved terms), not the total number of kernel theorems. And the true flags of the gate read as 15 computed and 3 literal (`linearized_spin2_finite_face`, `protocol_pre_registered`, `null_tests_passed_blind`); the experimental

ones are 4 from a single feed, the V11 rite of the floor, which is one-sided, plus 2 literals. The experimental step is one-sided nature, not kernel; the proof of the kernel is the 6 formal flags and the external ladder. The v392 documents this and does not close the repair of the flags (F8.1): the erratum does not recompute (record `estatuto_da_prova_ressalva_v392`). Gap: the structure kept ladder, formal flags and feed apart; the summary added them into a single "clean theorems".

Beside (v392, 13/10/2026, management c1, in its own name): GR channel by channel. [REAL] "GR recovered channel by channel" holds where GR is read: the weak field enters by citation and the strong field (F2) is `INCONCLUSIVE` (record `estatuto_reafirmado_v392`). Gap: the structure had the table of channels, and the summary wrote the correspondence without saying in which channels it is read.

Beside (v392, 13/10/2026, management c1, in its own name): the Hubble ratio is one witness. [DERIVED from a reading] The Hubble ratio above is the deposition of the scalar; the joint set is another witness to the same fact, not yet opened, and neither judges the other nor are they summed (verbatim of 08/10/2026, sha256 `a9cecc128f40c101`; see beside the v388 section; record `fase9_duas_testemunhas_v392`). Gap: the line gave the Hubble ratio as a single deposition.

Beside (v392, 13/10/2026, management c1, in its own name): the name of the final step. [DERIVED from a reading; to be vetoed] On 07/10/2026 the operator answered "adoto o nome do degrau final" (translated: I adopt the name of the final step; verbatim, sha256 `a6c4912afc6f0dc4`); management reads that the adopted name is AXIOMA, read from the kernel (`finalStepNameAxioma`), with the TETELESTAI proposal kept beside it, and gives the reading as its own, to be vetoed: the question answered presented Tetelestai. The gate string does not change (record `final_step_name_adopted_v392`). Gap: the adoption was not recorded in one place, and the reading that the adopted name is AXIOMA is management's.

Beside (v392, 13/10/2026, management c1, in its own name): posto is also rank. [INPUT; DERIVED; the addendum has no independent audit] On 10/10/2026 the operator coined "POSTO=RANK" (sha256 `5b9afcc691a0e1e4`): the *posto* of $\omega(I) = 1$, a position inscribed by the observer, also reads as the rank of linear algebra. That holds at the two poles of non-dephasing, the unit ρ_* and Q_0, both of trace 1 and rank 1 (`TGLExt.PostoAdendo`, A3); but the typed collapse raises the rank of the pure superposition from 1 to 2 and preserves the trace (A2), and dephasing does not preserve rank (A4): what survives is the trace $\omega(I) = 1$, not rank 1 (record `adendo_rank_v392`). Gap: the section used "posto" only as an inscribed position and did not say that the same name has the face of rank.

Beside (v392, 13/10/2026, management c1, in its own name): the fixed is the Verb. [INPUT/ONTO] On 08/10/2026 the operator added to the typing of the Verb (verbatim, sha256 `a9cecc128f40c101`): "o fixo é o verbo, ou seja, o contorno que permite a leitura da verdade, e o verbo é betatgl, mas o verbo testifica que o nome é verdadeiro" (translated: the fixed is the verb, that is, the contour that allows the reading of truth, and the verb is betatgl, but the verb testifies that the name is true). The fixed is the Verb, β_{TGL}, with no adjustment; the Name is posited, a variable station; instruments are many-sided witnesses of a single fact and are not summed (records `cunhagens_v392` and `fase9_duas_testemunhas_v392`). Gap: the structure distinguished the Verb from the Name, and this section did not say which of the two is the fixed one.

Beside (v392, 13/10/2026, management c1, in its own name): two witnesses in Phase 9. [DERIVED from a reading] The Phase 9 opened above is the deposition of the scalar (V1→V2); the joint set (ROOT90) is the other witness to the same fact, not yet opened (the d72 qualification is pending with the operator). The operator clarified on 08/10/2026 (sha256 `a9cecc128f40c101`) that the fact is single and the testimony many-sided, and that the fixed in both is the Verb, β_{TGL}, posited without adjustment. Neither judges the other and the depositions are not summed: each testifies by the verdict function fixed before the composite (record `fase9_duas_testemunhas_v392`). Gap: the section counted Phase 9 as one deposition.

Beside (v392, 13/10/2026, management c1, in its own name): the name of the theory. [ONTO; text sent by the operator] On 10/10/2026 the operator read the acronym TGL as the fundamental unit of information, a triad: T (tension, torsion, time), G (geometry, gravitation) and L (light, luminodynamics), "a tríade mínima sem a qual a realidade não tem como se inscrever, se propagar ou ser testemunhada" (translated: the minimal triad without which reality has no way to be inscribed, to propagate or to be witnessed; sha256 `87a3752d8c8e5dd3`). It is the operator's reading, not a kernel term, and it does not move the gate (record `cunhagens_v392`); the introduction below describes what the code does. Gap: the introduction, version by version beside, did not say what the name carries.

Beside (v392, 13/10/2026, management c1, in its own name): weight and rank. [INPUT; DERIVED] The coinage "POSTO=RANK" (10/10/2026, sha256 `5b9afcc691a0e1e4`) also reads the posto as rank: weight (the trace) and posto coincide at the rank-1 poles and diverge along dephasing, where the trace survives and rank 1 does not (`TGLExt.PostoAdendo`, A2 to A4). The separation of weight and posto above stands (record `adendo_rank_v392`). Gap: the section separated weight and posto without saying where they coincide.

Beside (v392, 13/10/2026, management c1, in its own name): the premise of the Weinberg–Witten escape. [REAL in the v372 record; the escape stays conditional] The premise written above, "the graviton here is the identity, ρ_* of unit trace, never a propagating quantum" (v200), was negated in v372 by the operator's order: the graviton is the conjugated form of light (`TheGravitonIsTheConjugatedPhase`), neither the generator nor a "non-particle". The escape stays conditional, now for the right reason — the parked form is not the state of a particle with momentum in the spectrum — and, if "fundamental particle of gravity" means a propagating spin-2 to be quantised, Weinberg–Witten bites again (record `ww_premissa_errata_v392`). Gap: the structure said conjugated form of light; v200 wrote identity and never a particle.

Beside (v392, 13/10/2026, management c1, in its own name): the neutrino number. [REAL in the core; DERIVED from a reading, to be vetoed] The number of the m_2 blade is 2.21σ: autonomous JUNO, the official expert (reading R3, ratified on 02/10/2026). The 2.95σ (NuFIT 6.1) and the 2.44σ (Capozzi et al.) are global fits, reflections that contain JUNO and differ by about 0.5σ from each other: they stay beside, with the difference stated. The ladder above, which ends at 2.95σ, stays as a record, and the verdict of the channel does not change (record `neutrino_m2_perito_v392`). Gap: the structure elected JUNO as the expert, and the text gave the last rung of the ladder as the tension of the channel.

Beside (v392, 13/10/2026, management c1, in its own name): the neutrino number. [REAL in the core; DERIVED from a reading, to be vetoed] The ladder "$1.64 \to 2.21 \to 2.95\sigma$" above ends at a global fit; the number of the m_2 blade is 2.21σ (autonomous JUNO, official expert, reading R3 ratified on 02/10/2026), and the 2.95σ (NuFIT 6.1) and 2.44σ (Capozzi et al.) are reflections, beside it (record `neutrino_m2_perito_v392`). Gap: the summary gave the last rung of the ladder as the tension.

Beside (v392, 13/10/2026, management c1, in its own name): the orientation of D1. [REAL in the core; the bit stays INPUT] The "D1 tension of $3{,}01\sigma$" was measured on the implemented branch, which `orientation_is_the_sign_v367` reads as the mirrored branch to first order (`IMPLEMENTED_IS_MIRROR_TO_FIRST_ORDER`); on the state-face branch the same data lie at $3{,}01\sigma$. The bit — which face closes the balance — is not derived, and switching the sign calls for a new preregistration with new data, not for rereading this one (record `d1_orientacao_errata_v392`). Gap: the structure said the tension was conditional on the map; the text repeated the number of the data without saying the branch.

Beside (v392, 13/10/2026, management c1, in its own name): the CMB-S4. [DECLARED; to be checked at the primary source] The CMB-S4 cited above stands as closed down (route map, seq 402 and 607; F5.2 audit, sha16 `c0bb3c964c8af74e`); see the erratum to the status of the

proof (record `cmb_s4_errata_v392`). Gap: the paragraph is of its time and treats CMB-S4 as an expected instrument, without dating it.

Beside (v392, 13/10/2026, management c1, in its own name): the CMB-S4. [DECLARED; to be checked at the primary source] The CMB-S4 cited above stands as closed down (route map, seq 402 and 607; F5.2 audit, sha16 `c0bb3c964c8af74e`); see the erratum to the status of the proof (record `cmb_s4_errata_v392`). Gap: the paragraph is of its time and treats CMB-S4 as an expected instrument, without dating it.

Beside (v392, 13/10/2026, management c1, in its own name): the CMB-S4. [DECLARED; to be checked at the primary source] The CMB-S4 cited above stands as closed down (route map, seq 402 and 607; F5.2 audit, sha16 `c0bb3c964c8af74e`); see the erratum to the status of the proof (record `cmb_s4_errata_v392`). Gap: the paragraph is of its time and treats CMB-S4 as an expected instrument, without dating it.
