TGL: zero free parameters

INPUT 1 (physics)

$\alpha = 7.2974 \times 10^{-3}$

(CODATA 2018)

INPUT 2 (mathematics)

$\sqrt{e} = 1.6487\ldots$

(square root of e, natural-log base)

$$\beta_{\mathrm{TGL}} = \alpha \cdot \sqrt{e} = 0.012031300400\ldots$$

$\theta_M = \arcsin\sqrt{\beta_{\mathrm{TGL}}} = 6.297^\circ$ | $\sin^2\theta_M = \beta_{\mathrm{TGL}}$ | $\cos^2\theta_M = 1 - \beta_{\mathrm{TGL}}$

All quantities below are DERIVED: H0 prediction, BBN ratio, Chandrasekhar mass, luminosity deviation, forbidden boundary, ...
